

The INTERLIS 2 reader and writer module (ili2fme) provides the Feature Manipulation Engine (FME) with access to INTERLIS 2 and INTERLIS 1 transfer files.

ili2fme is licensed under the LGPL (Lesser GNU Public License).

ili2fme includes software developed by The Apache Software Foundation (<http://www.apache.org/>).

ili2fme is in stable state.

This documentation describes version 4.6.x of ili2fme. The current version of ili2fme can be found at <http://www.eisenhutinformatik.ch/interlis/ili2fme/>.

This chapter assumes you are familiar with FME and the INTERLIS 1 and 2 formats. For more information about FME, please read the FME documentation. For more information about INTERLIS, go to <http://www.interlis.ch>.

Please send comments about ili2fme to [ce@eisenhutinformatik.ch](mailto:ce@eisenhutinformatik.ch).

## Overview

Features read from an INTERLIS file consist of a series of attribute values. They may have no geometry. The attribute names are as defined in the INTERLIS model. The feature type of each INTERLIS feature is the qualified INTERLIS name (for INTERLIS 2: the qualified name of the class, for INTERLIS 1: the qualified name of the table). The mapping of the inheritance hierarchy is done with a super or sub-type strategy.

ili2fme supports the rich geometry model of FME.

ili2fme can read and write INTERLIS 1 and 2. However, in most cases you will need a FME script or workbench to write INTERLIS.

## INTERLIS 2 Quick Facts

|                               |                          |
|-------------------------------|--------------------------|
| Format Type Identifier        | ch.ehi.fme.Main          |
| Long Format Name              | Swiss INTERLIS (ili2fme) |
| Reader/Writer                 | Both                     |
| Dataset Type                  | File                     |
| Feature Type                  | Class name               |
| Typical File Extensions       | .xtf, .xml, .itf, .ili   |
| Automated Translation Support | Automated reading        |
| User-Defined Attributes       | Yes                      |
| Coordinate System Support     | No                       |
| Generic Color Support         | No                       |
| Spatial Index                 | Never                    |
| Schema Required               | Yes                      |
| Transaction Support           | No                       |
| Geometry Type Attribute       | xtf_geomtype             |

## Geometry Support

| Geometry          | Supported | Geometry         | Supported |
|-------------------|-----------|------------------|-----------|
| aggregate         | no        | polygon          | yes       |
| circles           | no        | donut<br>polygon | yes       |
| circular<br>arc   | no        | line             | yes       |
| elliptical<br>arc | no        | point            | yes       |
| ellipses          | no        | text             | no        |
| none              | yes       | 3D               | yes       |

## Reading INTERLIS 1-Data

To read INTERLIS 1-data, the Model (.ili) must be known to FME.

It can be stored:

- in \$(FME)\plugins\interlis2\ilimodels
- in a special model directory you specify
- in the same directory than your data

Then you can select an INTERLIS 1-datafile (.itf) and open it with FME (Viewer, Workbench, Universal Translator) and use it.

- All the enumerations from the ITFs will be converted to texts (values).
- If more than one geometry exists, the first geometry will be used as FME geometry, the other ones will be stored as Hex Well Known Binary in Attributes.

## Reading INTERLIS 2-Data

Reading INTERLIS 2-data is essentially the same than reading INTERLIS 1-data with the following differences:

- The data comes in XTF-files (and not ITF-files)
- If your data models contain EXTENDS, FME will show all the data in a single "superstructure" – feature type. You will have to use an AttributeFilter on XTF\_CLASS to separate the different classes in Workbench. Since ili2fme-4.4.0, the data model may also be imported with a "subclass"-strategy rather than a "superclass"-strategy. When "subclass" is chosen, a feature type is created for each concrete extended class, whereas one feature type is created per parent class when "superclass" is chosen.

## Writing INTERLIS 1-Data

To write INTERLIS 1-data, the process is the following

Prerequisites: the INTERLIS model (.ili) has to exist before!

- Set up a Workbench
- Define an "Swiss INTERLIS (ili2fme)" destination dataset
- Import the feature type definitions from your ILI-model (Destination Data -> Import FeatureTypes -> Browse to your ILI-file)

- Define a transfer identification for each feature, by setting the format attribute "xtf\_id" (e.g. generate it with a counter or map a format attribute like OBJECTID / FID or similar)
- Route your features to the destination feature types (connect the arrows)
- GO!

## Writing INTERLIS 2-Data

To write out INTERLIS 2-data, you will have to follow these steps in addition to the ones explained for INTERLIS 1:

- Create one feature of feature type "XTF\_BASKETS" for each TOPIC (With a Creator / NullGeometryCreator + AttributeCreator)
- Reference this basket in each feature type of the topic, by setting the format attribute "xtf\_basket" (e.g. by attaching a constant).
- Write all herited classes to a "superstructure" feature type. (or choose a subclass-strategy)
- Define the qualified INTERLIS class name of each class, by setting the format attribute "xtf\_class" in each feature type

Please note, that:

- "XTF\_BASKETS" features must be created by hand in a common transformation with an INTERLIS 2 writer.
- "xtf\_basket" format attributes must be set by hand in a common transformation with an INTERLIS 2 writer.
- "xtf\_id" format attributes must be set/mapped in a common transformation with an INTERLIS 2 writer.
- You always need to provide fully qualified class names of the target INTERLIS model. For example, the correct parameter might be: "Fallbeispiel.Raumplanung.Bauzone".
- If the "xtf\_class" format attribute is set, its value supersedes the name of the feature type. This may lead to unexpected results if your features come from an INTERLIS dataset, and "xtf\_class" is still set (to the source class instead of the target class).

## Reader Reference

FME considers an INTERLIS transfer file to be a collection of features. The feature types are determined by scanning the transfer file and then reading the appropriate INTERLIS model/schema files. The model files have the extension .ili and should be located in the same folder as the transfer file and/or in the folder \${FME}/plugins/interlis2/ilimodels. A transfer file may need multiple model files. There are no DEF lines required.

### Reader Keywords

The following table lists the keywords processed by the INTERLIS reader. The table shows only the suffixes prefixed by the current <ReaderKeyword> in a mapping file.

| <i>Keyword Suffix</i> | <i>Value</i>   |
|-----------------------|--|
| MODELS                | Required INTERLIS-models to read the dataset (the model name, not the .ili-filename; separated by semicolons ';'). Or the special value %DATA, in which case the models are determined by inspecting the |

|                      |   |
|----------------------|---|
|                      | <p>transfer file.<br/>Default Value: %DATA</p>  |
| MODEL_DIR            | <p>Folder containing the .ili-files. These files are scanned for INTERLIS-models.<br/>You may use %XTF_DIR as placeholder for the directory of the data file that you will read. Multiple directories may be separated by semicolons ';'.<br/>Default Value: unset/empty</p>  |
| CREATE_LINETABLES    | <p>This keyword applies only to INTERLIS 1 datasets with INTERLIS AREA or INTERLIS SURFACE attributes.<br/>If set to True, ili2fme will create two additional feature types for each INTERLIS SURFACE or AREA attribute. One with the ending “_MT” containing the main table data as it appears in the transfer-file. The other additional feature type with the ending “_LT” containing the line helper table as it appears in the transfer-file.<br/>If set to False, ili2fme will create no additional tables.<br/>Default Value: False</p>  |
| SKIP_POLYGONBUILDING | <p>This keyword applies only to INTERLIS 1 datasets with INTERLIS AREA or INTERLIS SURFACE attributes.<br/>If set to True, ili2fme will not build polygons from the line tables as they appear in the transfer-file.<br/>If set to False, ili2fme will build polygons from the line tables and the (geo)-references as they appear in the transfer-file.<br/>Default Value: False</p>   |
| ILI1_ADDDEFVAL       | <p>This keyword applies only to INTERLIS 1 datasets.<br/>If set to True, ili2fme will parse the explanation at the end of attribute definitions that are optional. If there is not attribute value in the data, ili2fme will add the one given in the model. The syntax rule is:<br/>'//' 'undefiniert' '='<br/>Constant   'letztes' 'Zeichen'<br/>'//'.<br/>If the value in the model is 'letztes' 'Zeichen' ili2fme will follow the first reference attribute of this table, and use the length of the value of the first text attribute in the target table.<br/>If set to False, ili2fme will not supply any default values to the data.<br/>Default Value: False</p> |

|                            |  |
|----------------------------|--|
| <p>INHERITANCE_MAPPING</p> | <p>This keyword applies only to INTERLIS 2 datasets.</p> <p>If set to “SuperClass” the superclass inheritance mapping strategy is applied.</p> <p>If set to “SubClass” the subclass inheritance mapping strategy is applied.</p> <p>See the section titled “Inheritance mapping strategy” below for an explanation of the different strategies.</p> <p>Default Value: “SuperClass”</p>   |
| <p>ILI1_CONVERTAREA</p>    | <p>This keyword applies only to INTERLIS 1 datasets and if SKIP_POLYGONBUILDING is set to False.</p> <p>The name of a FME pipeline definition file (.fmi), to be used to build the FME polygons from the line helper table features of INTERLIS AREA attributes and main table features as read from the ITF file. ili2fme will set the following macros:</p> <ul style="list-style-type: none"> <li>• \$(lineTableName) name of FME feature type with polylines on input</li> <li>• \$(mainTableName) name of main FME feature type on input (point) and output (polygon/donut)</li> <li>• \$(maxOverlaps) max overlaps as defined by datatype of attribute in INTERLIS model</li> </ul> <p>The features that come out of the pipeline should have \$(mainTableName) as feature type and polygon or donut as geometry.</p> <p>If the filename is relative, the file is looked after in the folder of the workbench and then \$(FME)/plugins/interlis2/converter</p> <p>If the value is not set, ili2fme will use a built-in pipeline.</p> <p>Default Value: unset/empty</p> |
| <p>ILI1_CONVERTSURFACE</p> | <p>This keyword applies only to INTERLIS 1 datasets and if SKIP_POLYGONBUILDING is set to False.</p> <p>The name of a FME pipeline definition file (.fmi), to be used to build the FME polygons from the line helper table features of INTERLIS SURFACE attributes and main table features as read from the ITF file.</p> <p>ili2fme will set the following macros:</p> <ul style="list-style-type: none"> <li>• \$(lineTableName) name of FME feature type with polylines on input</li> <li>• \$(mainTableName) name of main FME feature type on input (point) and output (polygon/donut)</li> <li>• \$(mainTableRef) name of reference</li> </ul>  |

|           |  |
|-----------|--|
|           | <p>attribute in feature type<br/>\$(lineTableName)</p> <ul style="list-style-type: none"> <li>• \$(maxOverlaps) max overlaps as defined by datatype of attribute in INTERLIS model</li> </ul> <p>The features that come out of the pipeline should have \$(mainTableName) as feature type and polygon or donut as geometry. If the filename is relative, the file is looked after in the folder of the workbench and then \$(FME)/plugins/interlis2/converter. If the value is not set, ili2fme will use a built-in pipeline.<br/>Default Value: unset/empty</p> |
| TRACEMSGS | <p>This setting controls the level of detail of log messages written by ili2fme. If set to True, ili2fme will write detailed progress messages to the log. If set to False, ili2fme will only write normal progress messages to the log.<br/>Default Value: False</p>  |

## Writer Reference

The INTERLIS writer module stores features into an INTERLIS transfer file. The required models are determined by scanning the features and then reading the appropriate INTERLIS model/schema files. The model files have the extension .ili and should be located in the same folder as the transfer file and/or in the folder \${FME}/plugins/interlis2/ilimodels. A transfer file may need multiple model files. There are no DEF lines required.

The appropriate feature types are expected by the writer, as if the same model would have been read by the INTERLIS 2 reader.

This version of the Writer requires that the INTERLIS model already exists. The model can not be generated by the Writer. Therefore, in most cases you will need a FME script or workbench to prepare the expected feature types.

## Writer Keywords

The following table lists the keywords processed by the INTERLIS 2 writer. The table shows only the suffixes which will be prefixed by the current <WriterKeyword> in a mapping file.

| <i>Keyword Suffix</i> | <i>Value</i>  |
|-----------------------|---|
| MODELS                | <p>Required INTERLIS-models to write the dataset (the model name, not the .ili-filename; separated by semicolons ';'). Or the special value %DATA, in which case the models are determined by inspecting the FME features.<br/>Default Value: %DATA</p> |
| MODEL_DIR             | Folder containing the .ili-Files. These files   |

|                     |   |
|---------------------|---|
|                     | <p>are scanned for INTERLIS-Models.<br/> You may use %XTF_DIR as placeholder for the directory of the data file that you will write. Multiple directories may be separated by semicolons ‘;’.<br/> Default Value: unset/empty</p>   |
| INHERITANCE_MAPPING | <p>This keyword applies only to INTERLIS 2 datasets.<br/> If set to “SuperClass” the superclass inheritance mapping strategy is applied.<br/> If set to “SubClass” the subclass inheritance mapping strategy is applied.<br/> See the section titled “Inheritance mapping strategy” below for an explanation of the different strategies.<br/> Default Value: “SuperClass”</p>  |
| USE_LINETABLES      | <p>This keyword applies only to INTERLIS 1 datasets with INTERLIS AREA or INTERLIS SURFACE attributes.<br/> If set to True, ili2fme will expect one additional feature type for each INTERLIS SURFACE or AREA attribute. The additional feature type with the ending “_\$(attributeName)” contains the line helper features as they should appear in the transfer-file.<br/> If set to False, ili2fme will create the line helper table out of the polygons/donuts.<br/> Default Value: False</p> |
| TRACEMSGS           | <p>This setting controls the level of detail of log messages written by ili2fme.<br/> If set to True, ili2fme will write detailed progress messages to the log.<br/> If set to False, ili2fme will only write normal progress messages to the log.<br/> Default Value: False</p>  |

## Feature Representation

The following clauses describe how ili2fme maps INTERLIS objects to FME features.

### Overview

#### INTERLIS 1

INTERLIS allows for some nesting of type definitions. A class or table is defined in a topic. Several topics are grouped to a model. FME doesn't allow such a nesting. Therefore ili2fme maps INTERLIS class with their qualified name to FME feature types.

### INTERLIS model

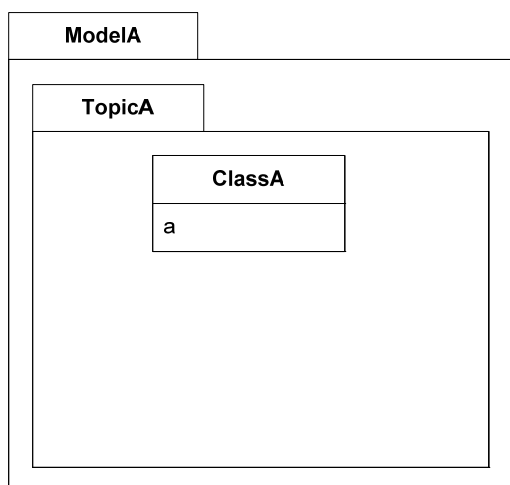

Each FME feature type has a format attribute xtf\_id that is the transfer identification of that feature in the ITF file.

### INTERLIS 2 full transfer mode

For INTERLIS 2 the mapping is the same as for INTERLIS 1 with an additional format attribute and format feature.

### FME feature schema

### INTERLIS model

An INTERLIS 2 data file may contain multiple baskets (instances of a topic; set of objects) of the same topic. To know which feature belongs to which basket, each feature has a reference to the basket in the format attribute “xtf\_basket”. Each basket is represented as an instance of the format feature type “XTF\_BASKETS”. The attribute “xtf\_topic” holds the qualified topic name that describes this basket (in this case that would be “ModelA.TopicA”). The attribute “xtf\_id” of the feature type “XTF\_BASKETS” is the transfer identification of the basket.

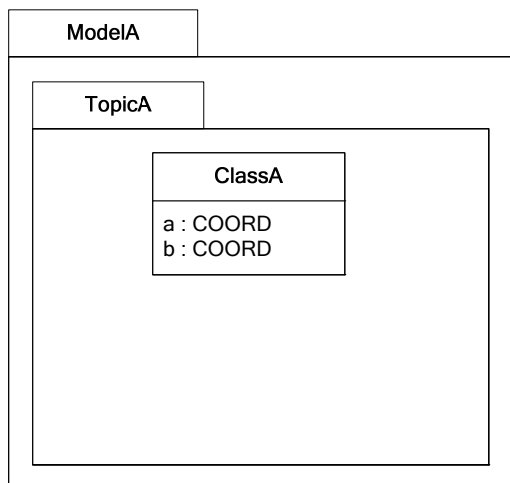

### FME feature schema

### Multiple geometries per class

An INTERLIS class may defined multiple attributes of type geometry.

**INTERLIS model**

**FME feature schema**

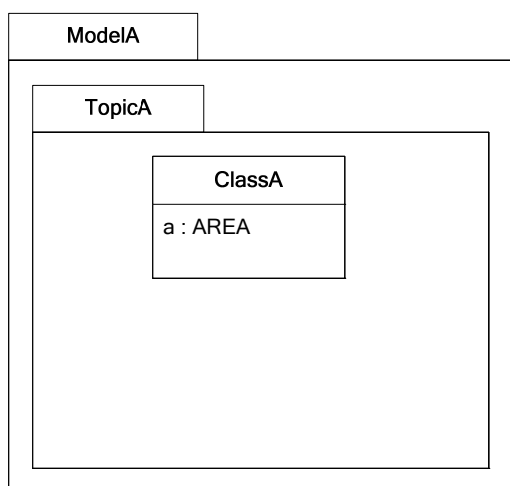

ili2fme maps the first geometry of the INTERLIS class to the FME geometry of the feature. Any additional INTERLIS geometry attributes are mapped to ordinary FME attributes. The value of these attribute (in this case the attribute “b”) is HEX encoded OGC WKB and can be extracted from that attribute to the feature geometry with the transformer “GeometryReplacer” or set with “GeometryExtractor”.

### **INTERLIS 1 AREA**

INTERLIS 1 encodes attributes of type AREA in helper table before the main table. ili2fme can read these attributes in three modes:

- build automatically polygons/donuts out of the line table
- read the main table and the line table as they are in the transfer file
- combination of the the two cases before

With automatic polygon building the mapping is as follows

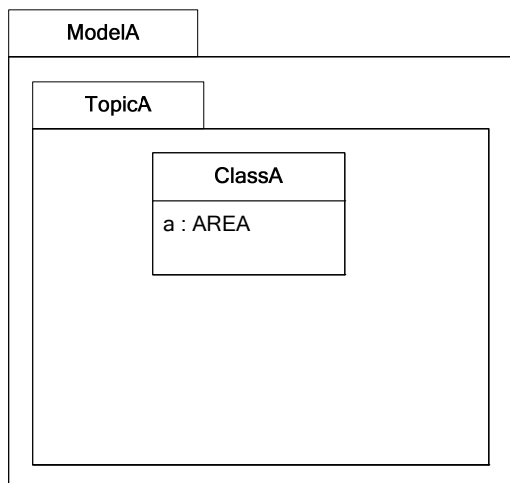

**INTERLIS model**

**FME feature schema**

With automatic polygon build disabled, the mapping is as follows

INTERLIS model

FME feature schema

### INTERLIS 1 SURFACE

INTERLIS 1 encodes attributes of type SURFACE in helper table after the main table. ili2fme can read these attributes in three modes:

- build automatically polygons/donuts out of the line table
- read the main table and the line table as they are in the transfer file
- combination of the the two cases before

With automatic polygon building the mapping is as follows

INTERLIS model

FME feature schema

With automatic polygon build disabled, the mapping is as follows

**INTERLIS model**

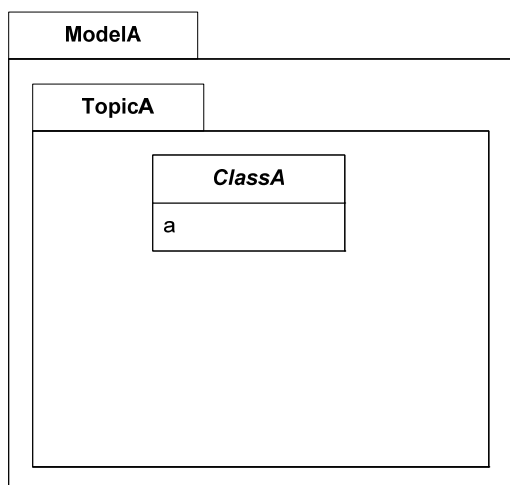

**FME feature schema**

The line table (“ModelA.TopicA.ClassA\_a\_LT”) gets an additional attribute (with the name of the main class; in this case “ClassA”) that is a reference from the lines to the feature in the main table (“ModelA.TopicA.ClassA\_MT”)

### ***INTERLIS 2 incremental transfer***

INTERLIS 2 supports incremental transfers (change only transfers). Incremental transfer happens per basket. There are two kind of incremental transfers: INITIAL and UPDATE. INITIAL ist the first transfer in a serie of transfers. It includes all objects. UPDATE is used for all succeeding transfers after INITIAL and includes only changed objects since the last transfer. Both kinds require additional format attributes.

**INTERLIS model**

**FME feature schema**

For an INITIAL data transfer, the XTF\_BASKETS feature that represents the basket has a value in the “xtf\_endstate” attribute. The “xtf\_startstate” attribute should not be set. There are no “XTF\_DELETEOBJECT” features. The “xtf\_operation” attribute should not be set.

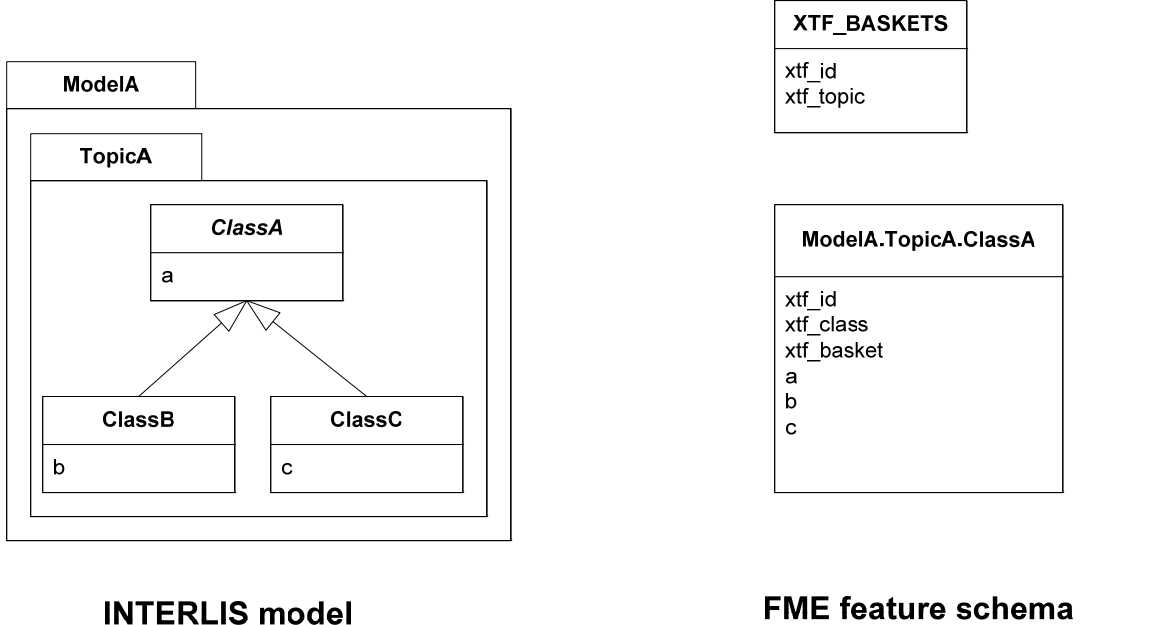

For an UPDATE data transfer, the XTF\_BASKETS feature that represents the basket has a value in the “xtf\_startstate” and the “xtf\_endstate” attribute. The “xtf\_startstate” value is the same as the “xtf\_endstate” of the last transfer of that basket. The “xtf\_operation” attribute should be set to “INSERT”, “UPDATE” or “DELETE”. Instead of mapping deleted objects to ordinary features with “xtf\_operation” set to “DELETE”, they may alternatively be mapped to instances of the format feature type “XTF\_DELETEOBJECT” (without any INTERLIS attribute values; just “xtf\_id” and “xtf\_basket”).

**Inheritance mapping strategy**

ili2fme supports to inheritance mapping strategies. Depending on you INTERLIS model, one or the other is appropriate.

**Superclass strategy**

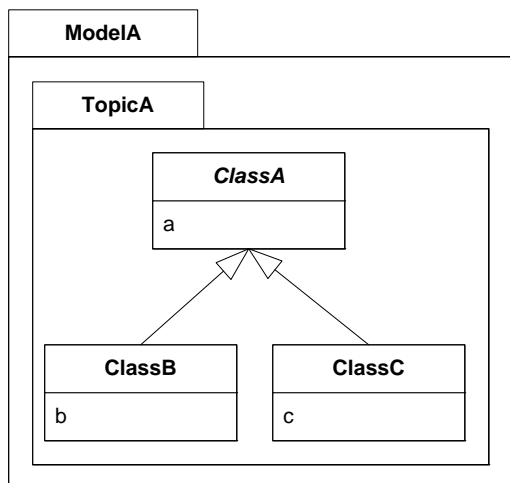

Attributes of non-root classes are shifted to the root, as illustrated by the following figure:

The format attribute „xtf\_class“ may be used to determine if a feature is an instance of class „ModelA.TopicA.ClassB“ or class „ModelA.TopicA.ClassC“.

**Subclass strategy**

Attributes of base classes are shifted to leafs, as illustrated by the following figure:

| XTF_BASKETS         |
|---------------------|
| xtf_id<br>xtf_topic |

| ModelA.TopicA.ClassB                        |
|---|
| xtf_id<br>xtf_class<br>xtf_basket<br>a<br>b |

| ModelA.TopicA.ClassC                        |
|---|
| xtf_id<br>xtf_class<br>xtf_basket<br>a<br>c |

### INTERLIS model

### FME feature schema

There is no feature type “ModelA.TopicA.ClassA” because it’s an abstract class in the INTERLIS model.

### Reference

#### Format Attributes

In addition to the generic FME feature attributes that FME Workbench adds to all features (see *About Feature Attributes* on page 1), this format adds the format-specific attributes described in this section.

| <i>Attribute</i> | <i>Description</i>   |
|------------------|--|
| xtf_id           | Value of the TID XML-attribute out of the INTERLIS transfer file. Unique across all feature types.   |
| xtf_class        | Qualified name of the INTERLIS class name. This is different from the feature type name in the case of non base classes. In the figure above would ModelA.TopicA.ClassB be a possible value. If this value is not set, the feature type name is used as the qualified INTERLIS class name. |
| xtf_basket       | Value of the BID XML-attribute out of the INTERLIS transfer file. May be used as foreign key to a feature of the feature type XTF_BASKET (see below). On writing, this may be used to write multiple baskets of the same topic.  |

|                 |   |
|-----------------|---|
|                 | If writing INTERLIS 1 transfer files, this attribute is not required.   |
| xtf_operation   | Only used for incremental INTERLIS 2 transfer. Possible values are: INSERT, UPDATE, DELETE.                         |
| xtf_consistency | Only used for somehow modified data. Not yet fully supported.   |
| xtf_geomattr    | <i>Deprecated: Name of the geometry attribute read. A INTERLIS 2 class may define multiple geometry attributes.</i> |

## Format features

The reader creates additional feature types, and the writer expects this feature types as well. If writing INTERLIS 1 transfer files, these feature types are not required.

### Format feature type XTF\_BASKETS

| <i>Attribute</i> | <i>Description</i>  |
|------------------|---|
| xtf_id           | For each basket in the INTERLIS 2 transfer file, the value of the BID XML-attribute.  |
| xtf_topic        | Qualified name of the INTERLIS 2 topic name. In the figure above would ModelA.TopicA be a possible value.   |
| xtf_startstate   | Only used for incremental INTERLIS 2 transfer. If set, it indicates an UPDATE transfer. It indicates an INITIAL transfer, if it is not set. If it is not an incremental transfer, the value is ignored. |
| xtf_endstate     | Only used for incremental INTERLIS 2 transfer. If set, it indicates an incremental transfer. If it is not set, this is not an incremental transfer.   |
| xtf_consistency  | Only used for somehow modified data. Not yet fully supported.   |

### Format feature type XTF\_DELETEOBJECT

| <i>Attribute</i> | <i>Description</i>  |
|------------------|---|
| xtf_id           | Value of the TID XML-attribute out of the INTERLIS transfer file. Unique across all feature types.  |
| xtf_basket       | Value of the BID XML-attribute out of the INTERLIS transfer file. May be used as foreign key to a feature of the feature type XTF_BASKET. On writing, this may be used to write multiple baskets of the same topic. |

Features written to the INTERLIS transfer file are expected to have the same structure, as they would have had when read.

## Limitations

- custom line forms
- XTF line attributes
- recursive structure attributes

## Installation

### **Requirements**

For the current version of ili2fme, you will need a JRE (Java Runtime Environment) installed on your system, version 1.4.1 or later.

The JRE (Java Runtime Environment) can be downloaded for free from the Website <http://www.java.com/>.

ili2fme was tested with FME 2008 (20080121 - Build 5164).

### **Files**

To install ili2fme, choose a directory and extract the distribution file there.

Copy the files and subdirectories of "\${ili2fme}/FME Suite" to your FME directory.

Add your standard INTERLIS models to the directory "\${FME}/plugins/interlis2/ilimodels".

At runtime, ili2fme requires the following files:

```
${FME}/plugins/ili2c.jar  
${FME}/plugins/ili2fme.jar  
${FME}/plugins/jts-1.8.jar  
${FME}/metafile/ch.ehi.fme.Main.fme  
${FME}/formatsinfo/interlis2.db
```

### **Configuration**

To use ili2fme with the FME Universal Viewer, FME requires you to set an environment variable: FME\_VIEWER\_THREADING=SINGLE.

ili2fme doesn't use or require any windows registry entries or user settings file.

### **How to migrate/update an existing ili2fme installation**

Just copy the files and subdirectories of the new "\${ili2fme}/FME Suite" to your FME directory.

Starting with ili2fme version 4.0, there is no longer a native part required. You may delete the files iom\_fme.dll and xerces-c\_2\_6-interlis2.dll.

## FAQ

### Usage

#### ***I am getting the following error: “missing model Roads”***

In the folder of your data-file or your folder `${FME}/plugins/interlis2/ilimodels` there is no .ili-file containing a “MODEL Roads”. Move the file Roads.ili to the folder of your data-file or the folder `${FME}/plugins/interlis2/ilimodels`.

#### ***My destination format is INTERLIS 2 and I’m getting the following error: “model name not specified”***

You must change the Parameter “MODELS” to “%DATA” or the name of the INTERLIS model (without extension .ili) that you intend to write (on the Destination Dataset).

#### ***My destination format is INTERLIS 2 and I’m getting the following error: “missing mandatory attribute xtf\_class.”***

The appropriate feature types are expected by the writer, as if the same model would have been read by the INTERLIS 2 reader. That means: Every feature type must have the Attributes `xtf_id`, `xtf_class`, `xtf_basket`. There must be a feature type `XTF_BASKET` with attributes `xtf_id` and `xtf_topic`.

#### ***My destination format is INTERLIS 2 and I’m getting the following error: “missing mandatory attribute xtf\_basket.”***

The appropriate feature types are expected by the writer, as if the same model would have been read by the INTERLIS 2 reader. That means: Every feature type must have the Attributes `xtf_id`, `xtf_class`, `xtf_basket`. There must be a feature type `XTF_BASKETS` with attributes `xtf_id` and `xtf_topic`.

#### ***I have an INTERLIS model “Roads.ili”. Should I place into the folder `${FME}/plugins/interlis2/ilimodels`?***

Yes, if you read or write data according to that model more than once. (ili2fme will also look in the folder of your data-file for INTERLIS models.)

#### ***Is the ordering of the model names as a value of the FME-keyword “ili2fme\_Models” significant?***

No, any ordering will do.

#### ***If a model imports other models (like “Units” or “CoordSys”), should I name all models as value of the FME-keyword “ili2fme\_Models”?***

No, but all required models (including indirectly imported ones), all required .ili-files, should be in the folder of your data-file or the folder `$(FME)/plugins/interlis2/ilimodels`.

#### ***If a model imports other models (like “Units” or “CoordSys”), which one should I name as value of the FME-keyword “ili2fme\_Models”?***

Use the most specific one (the one that imports directly or indirectly all the other ones). The imported models will be used automatically.

#### ***If a model extends another one, which one should I name as value of the FME-keyword “ili2fme\_Models”, the base model or the extended one?***

Use the extended one. The base model will be used automatically.

#### ***I would like to convert to a particular INTERLIS model. How can I import the feature types?***

Import the INTERLIS model file (file with the extension .ili), instead of a INTERLIS data file. (You have to change the Filetype in the file selector dialog to “All Files” to see the ili-files.)

## **Mapping**

### **How to map XTF\_ID, XTF\_CLASS, XTF\_BASKET if INTERLIS 2 is the destination format?**

XTF\_ID is the XML attribute TID and should be unique across all feature types. Typically the value of the primary key of the source feature.

XTF\_CLASS the qualified name of the destination INTERLIS-class. Typically a constant like "ModelName.TopicName.ClassName" (the actual value depends on your INTERLIS model).

XTF\_BASKET is the foreign key of a feature of type XTF\_BASKETS.

### **How to specify at export the kind of transfer (FULL, INITIAL, UPDATE) and the kind of feature operation (INSERT, UPDATE, DELETE)?**

The kind of transfer is indicated by values in the attributes "xtf\_startstate" and "xtf\_endstate" of the format feature type "XTF\_BASKETS". If "xtf\_endstate" is not set, it's an FULL transfer. If "xtf\_endstate" is set and "xtf\_startstate" is not set, it's an INITIAL transfer. If "xtf\_endstate" and "xtf\_startstate" are set, it's an INITIAL transfer.

The values INSERT, UPDATE, DELETE are required for incremental transfer. Use the format attribute "xtf\_operation".

### **What is the purpose of the feature type "XTF\_DELETEOBJECT"?**

It's a shortcut to signal "this object is no longer in the basket".

### **What is the purpose of the format attribute "xtf\_operation"? Which are the possible values?**

This format attributes indicate the kind of change to the object. Possible values are: INSERT, UPDATE, DELETE. It's only use with incremental transfer mode.

### **What is the purpose of the format attribute "xtf\_consistency"? Which are the possible values?**

Possible values are: COMPLETE, INCOMPLETE, INCONSISTENT, ADAPTED.

### **If an attribute is of type enumeration (like „color: (red,green,blue);“: Is it possible to get the values (0,1,2,...) instead of the resolved names?**

No. In INTERLIS 2 the resolved name is the value. In INTERLIS 2 there is no mapping of an enumeration to a numeric.

### **How are foreign keys mapped?**

The value of the REF XML-attribute of the role (association end) gets the property value of the feature, that contains the role.

### **How are 1-1 associations mapped?**

Like defined by the INTERLIS 2-encoding rules. The end class of the second role (association end) gets the property with the reference/foreign key. The property gets the name of the first role.

### **How are BAG/LIST-attributes mapped?**

BAG/LIST-attributes are mapped as list attribute.

### **How is inheritance mapped?**

ili2fme uses a super or subclass strategy.

### **My INTERLIS model contains a lot of classes, but in FME, I see only a few of them as feature types. Why?**

ili2fme uses by default a super type strategy to map the inheritance tree of the INTERLIS classes. Only root classes in INTERLIS become feature types in FME. You may consider changing the mapping strategy to subclass.

## **How can I read the TID of records out of INTERLIS 1 transfer files (files with extension .itf)?**

The TID is accessible through the XTF\_ID attribute in each feature type.

## **Configuration**

### ***I've modified the file formats.db. Why does FME still report: "No Reader named 'ch.ehi.fme.Main' is available in this FME version"?***

- Maybe jvm.dll is not found by FME.

FME uses standard registry entries to find the JVM. Check your JAVA installation.

## **Changes**

See the file CHANGELOG.txt in the distribution of ili2fme.

## **License**

GNU LESSER GENERAL PUBLIC LICENSE

TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License Agreement applies to any software library or other program which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Lesser General Public License (also called "this License"). Each licensee is addressed as "you".

A "library" means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term "modification".)

"Source code" for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

1. You may copy and distribute verbatim copies of the Library's complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and distribute a copy of this License along with the Library.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

a) The modified work must itself be a software library.

b) You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.

c) You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.

d) If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful. (For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.) These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it. Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library. In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices. Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy. This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

4. You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange. If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

5. A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library". Such a work, in isolation,

is not a derivative work of the Library, and therefore falls outside the scope of this License. However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License. Section 6 states terms for distribution of such executables. When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law. If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.) Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

6. As an exception to the Sections above, you may also combine or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer's own use and reverse engineering for debugging such modifications. You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

a) Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable "work that uses the Library", as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)

b) Use a suitable shared library mechanism for linking with the Library. A suitable mechanism is one that (1) uses at run time a copy of the library already present on the user's computer system, rather than copying library functions into the executable, and (2) will operate properly with a modified version of the library, if the user installs one, as long as the modified version is interface-compatible with the version that the work was made with.

c) Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.

d) If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.

e) Verify that the user has already received a copy of these materials or that you have already sent this user a copy. For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the materials to be distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself

accompanies the executable. It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

7. You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:

a) Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the Sections above.

b) Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

8. You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

9. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

10. Each time you redistribute the Library (or any work based on the Library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties with this License.

11. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library. If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances. It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice. This section is intended

to make thoroughly clear what is believed to be a consequence of the rest of this License.

12. If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

13. The Free Software Foundation may publish revised and/or new versions of the Lesser General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns. Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

14. If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

#### NO WARRANTY

15. BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS
